

# **Source Water Protection Planning**

Using THREATS to Reduce the Heavy  
Lifting

**Steph Neufeld, M.Sc., Watershed Manager  
ALMS Conference**

# Source Water Protection Planning

- 1<sup>st</sup> step in a multi-barrier approach to protect water quality and quantity and understand and mitigate potential risks

# Source Water Protection Plan Components

American Water and Wastewater Association's (AWWA) Standard

Successful source water protection programs may vary widely in their details, but successful programs share six fundamental elements (AWWA 2010):

1. Source Water Protection Plan Vision
2. Characterization of Source Water and Source Water Protection Area
3. Source Water Protection Goals
4. Source Water Protection Action Plan
5. Program Implementation
6. Periodic Evaluation and Revision

**THREATS**

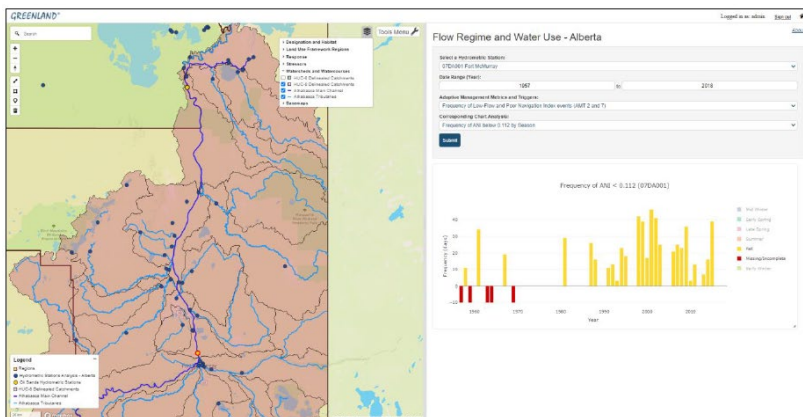

**What can it do?**

# An Introduction to THREATS

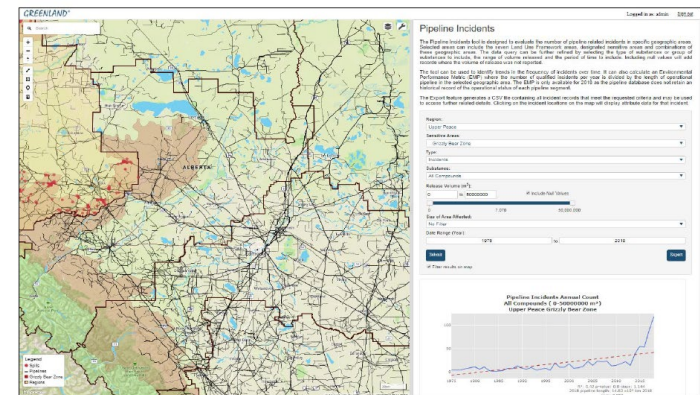

The Healthy Rivers Ecosystem Assessment System (THREATS) is a platform for accessing and viewing complex spatial and time series data. It can be customized to include data and tool sets that address specific requirements.

Information Platform for Decision Support and Evaluation of Cumulative Environmental Effects

THREATS™ – Athabasca River Flow Regime and Navigation Index Analysis

THREATS™ – Pipeline incidents metric for Alberta with temporal spill query and regard for sensitive land features (incl. wetlands, wildlife, fisheries, etc.)

# Delineating Your Boundary

The first task in completing a SWP Plan is to define and delineate the area of concern which includes the entire watershed upstream of the source intake.

Often this watershed boundary is unique to the drinking water provider and will not follow a sub-watershed or larger basin watershed boundaries.

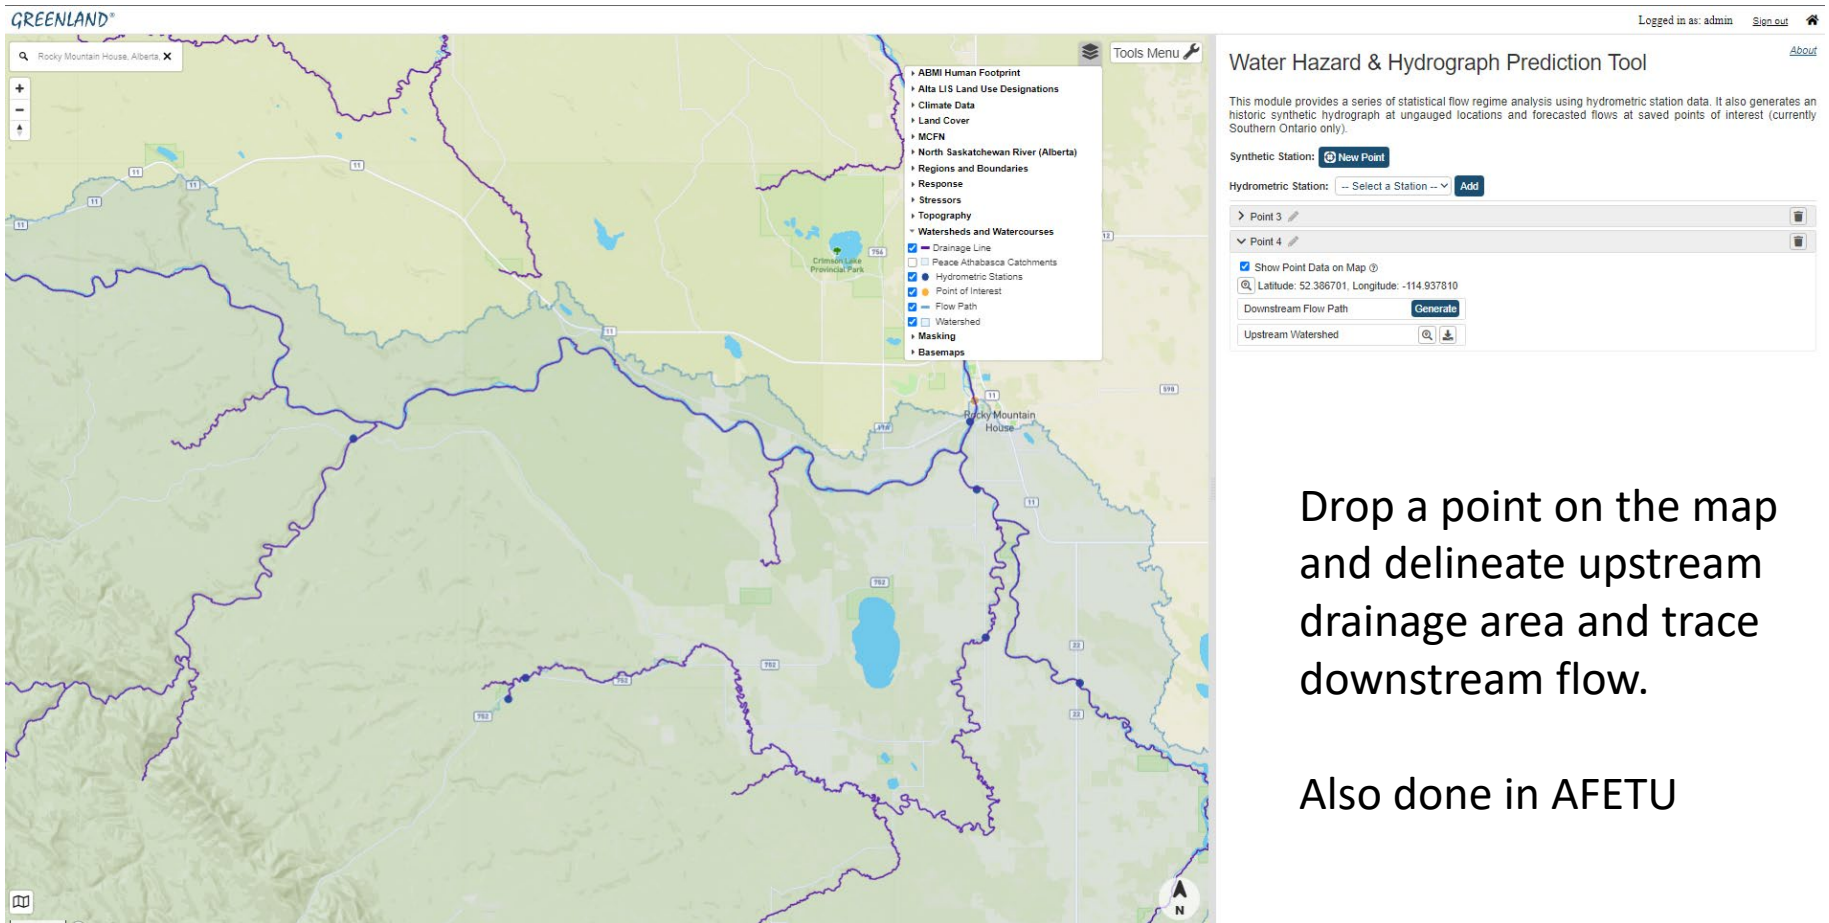

Delineation and mapping of the watershed can be achieved through use of a GIS program and using a digital elevation model.

Similarly, this information may be available through the Watershed Planning and Advisory Council in which the drinking water watershed is in.

**Alternatively, THREATS is able to generate delineated catchments at user specified outlets where data is available or pre-defined catchment areas can be loaded.**

# Source Watershed Delineation

Historically: Delineation and mapping of the watershed can be achieved through use of a GIS program and using a digital elevation model and expertise

# Land Use Mapping Considerations

- Spatially displaying land activities in the watershed through GIS layer
- These layers may be related to
  - resource extraction
  - parks and protected areas
  - roads and other linear disturbance
  - urban footprints
  - agricultural practices
  - sewage disposal facilities
  - natural topography
  - land cover classes (wetlands, forested areas, etc.)
- **THREATS contains an ever-expanding library of relevant map layers and temporal data**

## Spatial Analysis Module

The Spatial Analysis Module accesses multiple spatial data sets from a variety of sources and computes spatial indicator values according to user interest. It may be useful to represent the level of cumulative impact from anthropogenic activities in a watershed over time. It can be used to aggregate and summarize other types of spatial data within user specified areas.

# Land Use Inventory: Livestock

THREATS Spatial Analysis Module is being updated to enable spatial weighting of attribute table data. This is a particularly important feature for data like Census of Agriculture which has more than 120 numeric value fields associated with CCS polygons. The new module will be able to summarize data similar to the following:

Table xx. Livestock number and density by livestock type.

<b>Livestock Type</b>	<b>Number</b>	<b>Density (individuals/km<sup>2</sup>)</b>
Cattle	19878	13.3
Sheep	431	0.29
Pigs	9	0.006
Poultry	89845	60.2

Table xx. Livestock number and density by livestock type.

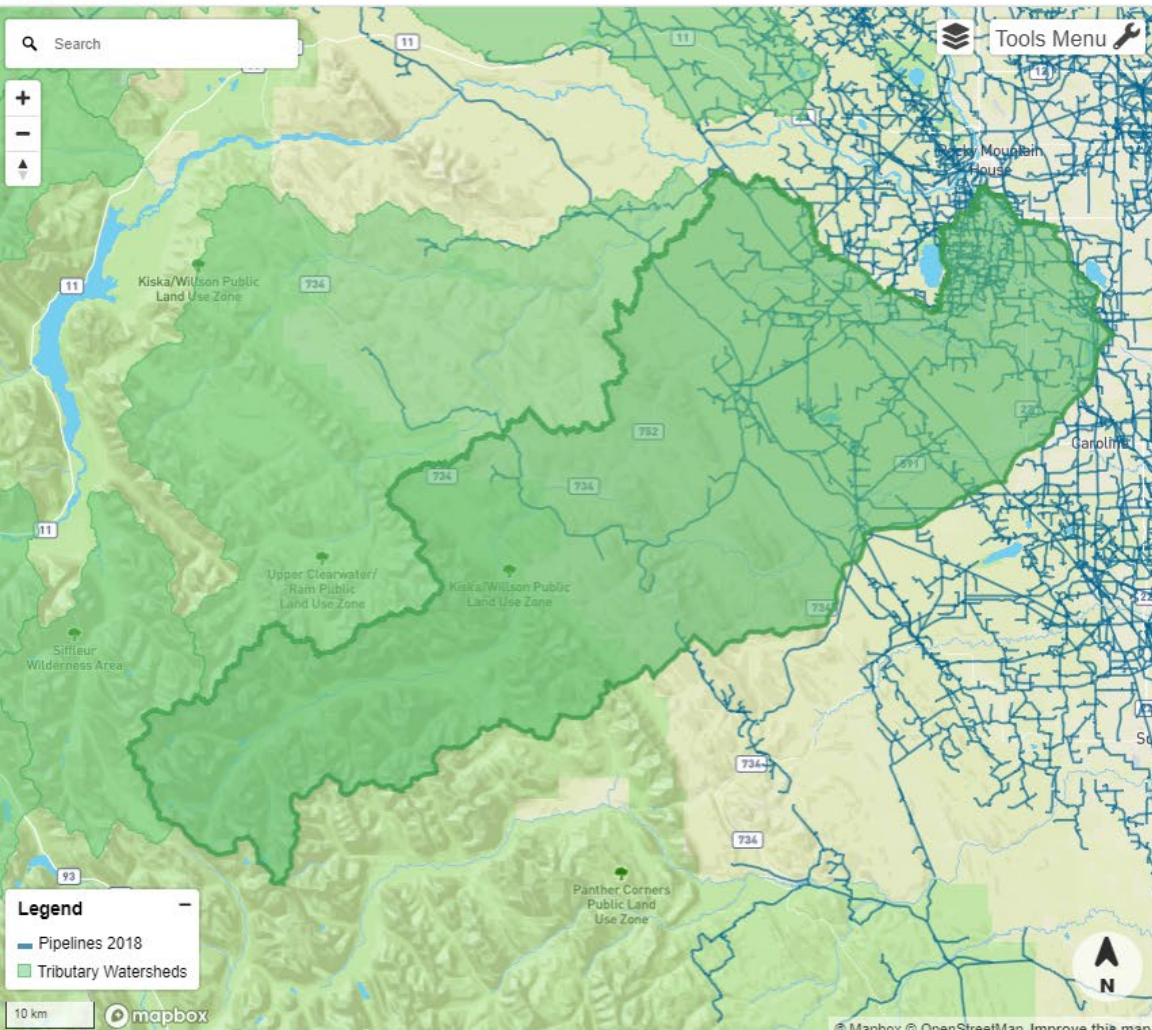

<b>Land Use</b>	<b>Area (ha)</b>	<b>Area Density (ha/km<sup>2</sup>)</b>
Cropland	16991	11.4
Improved Pasture	8562	5.7
Unimproved Pasture	38720	25.9
Total Agricultural Land	73206	49.0

# Land Use Mapping Considerations

- Accessing a comprehensive suite of GIS layers and synthesizing these layers into useful maps and completing data analysis is not straightforward.
- Availability of Data Layers
- Capacity (either technical expertise or monetary)
- Leveraging an established partnership (AESRD or WPAC)
- Engaging consultant
- The best option is to share resources with organizations doing basin planning at the larger scale.
- For example, as part of their watershed planning activities WPACs often have in-house databases and have established data sharing agreements.
  - NSWA versus Okotoks

# Water Quality Assessment Considerations

- An integral part SWPP includes gathering scientific data to assess source water quality and quantity, fostering collaborative long-term monitoring programs to evaluate source waters and effluent impacts, and participating in research partnerships to understand evolving contaminants of concern.
- This work also includes investigating linkages between water quality and quantity and environmental influences (land use, climate change, etc.).
- For a small, or even large, municipality/drinking water provider this task can be monumental.
- Compiling the necessary monitoring data to characterize the source watershed alone is a challenge. This is in part because historical sampling programs may have not been designed to characterize water quality in the defined source water area.
- Historically much of the water quality monitoring of rivers and streams has been completed by AEP

# Overview of THREATS Capabilities and Benefits

- Time efficient compared to traditional/manual data collection
- Variety of analysis types including water quality, hydrology, air, land and geospatial
- Enables both a widespread and deep understanding of the site/project
- Widening our repertoire leads to improved decision making
- Leads to costs savings in saved working hours and applications

# Conclusion

- To complete source water protection planning good data is needed
- This data needs to be summarized and assessed to inform risk
- Although that process still requires expertise, a tool that pulls data together and allows some assessment is a big step in forwarding source water protection planning in Alberta
